

Action Careers - Your Take-Home API Project Challenge

Your task is to create a simple **Node.js** RESTful application with only one endpoint that makes an API call to [Action Careers](https://www.actian.com/careers) and request an HTML page, and parse through the HTML to retrieve list of **titles of open positions** for a **department**.

The application endpoint should work for every department section under **Open Positions** from <https://www.actian.com/company/careers> link.

The http response content must contain a list of titles of open positions for a department with appropriate http status code.

An example:

Request: Get list of open positions for department "Engineering"

Response: Contains list of current job openings for department "Engineering" from *Action Careers* page

The department name is mandatory. In case of no department, please return the message "Department is required!"

In the case of no department in the page, please return the message "No department found!".

You can either use Typescript or JavaScript and use the built-in fetch API or `npm install` a community package to perform requests.

Good luck!
